“AFLATOXINS WERE REDUCED SUBSTANTIALLY WHEN AF36 WAS INOCULATED IN ALMONDS”

— Study authored by:

Themis Michailides, *Kearney Agricultural Research & Extension Center / University of California, Davis*

Dr. Peter Cotty, *USDA/ARS & University of Arizona*

William P. Barney, *IR-4 Project, Rutgers University*

WHAT ARE AFLATOXINS?

Aflatoxins are toxic chemicals produced by various strains of the common fungi *Aspergillus flavus* and *Aspergillus parasiticus*. Aflatoxins cause cancer in certain experimental animals at very low concentrations (1 part per billion). Aflatoxins are also associated with human liver cancer.

WHAT DOES AF36 DO?

When AF36 is applied to almond orchards at the appropriate time, it competes with other strains of *Aspergillus flavus* that produce large amounts of aflatoxin and, in doing so limits or reduces the amount of these high aflatoxin producers that become associated with the crop.

HOW TO ORDER:

CONTACT YOUR TRUSTED AG CHEM DEALER

Or contact Steve Haught at Western Milling Agribusiness for product information
